L=Distance Between Transverse Joints

Note:
Transverse joints shall match existing joints in adjacent lanes of paving.

PCC PAVEMENT TRANSVERSE CONSTRUCTION
JOINTS WITH TIE BARS OR DOWEL BARS

CITY OF RAPID CITY
PUBLIC WORKS DEPARTMENT

DATE: 8-19-22
Sec. - Sht. 40-1a
**DETAIL A**
TRANSVERSE CONSTRUCTION JOINT WITH TIE BARS

Notes:
1. The term "In Place PCC Pavement" in the above drawing indicates that the in place PCC pavement was placed on a previous project.
2. The tie bars will be embedded a minimum depth of 9" into the in place PCC pavement and anchored with an epoxy resin adhesive.
3. No. 8 epoxy coated deformed tie bars shall be used in 7" to 7 1/2" thick PCC pavement, No. 9 epoxy coated deformed tie bars will be used in 8" to 10" thick PCC pavement and No. 10 epoxy coated deformed tie bars will be used in 10 1/2" thick and greater PCC pavement. The tie bar spacing will be 18" center to center and will be a minimum of 3" and a maximum of 9" from the pavement edges.

**DETAIL B**
TRANSVERSE CONSTRUCTION JOINT WITH DOWEL BARS

Notes:
1. The term "In Place PCC Pavement" in the above drawing indicates that the in place PCC pavement was placed on a previous project.
2. The plain round dowel bars will be embedded a minimum depth of 9" into the in place PCC pavement and anchored with an epoxy resin adhesive.
3. The epoxy coated plain round dowel bar size, number, and spacing will be the same as detailed on the corresponding dowel bar assembly, see Detail 40-6. The epoxy coated plain round dowel bars will be a minimum of 3" and a maximum of 6" from the pavement edges.

PCC PAVEMENT TRANSVERSE CONSTRUCTION JOINTS WITH TIE BARS OR DOWEL BARS

DATE: 8-19-22
Sec. - Sht. 40-1b
Notes:
1. When concrete pavement is formed and a keyway is provided, a metal recess strip will be used. When concrete pavement is slip formed, a metal recess strip is not required.
2. The term "In Place PCC Pavement" in the above drawing indicates that the in place PCC pavement was placed on the current project.
SAWED LONGITUDINAL JOINT WITH TIE BARS
(Poured Monolithically)

Notes:
1. Tie bar spacing shall be 48" center to center and shall be supported so the tie bar remains in place as detailed during paving operations.
2. The first saw cut to control cracking will be a minimum of 1/3 the thickness of the pavement. Additional sawing for widening the saw cut to provide the width for the installation of the hot poured elastic joint sealer is necessary.

T=Pavement Thickness

LONGITUDINAL CONSTRUCTION JOINT WITH TIE BARS

Note:
The No. 5 epoxy coated tie bars shall be embedded a minimum of 9" into the in place PCC pavement and anchored with an epoxy resin adhesive. Tie bar spacing shall be 30" center to center when no keyway is present.
LONGITUDINAL CONSTRUCTION JOINT WITH KEYWAY AND TIE BARS

Notes:
1. When concrete pavement is formed and a keyway is provided, a metal recess strip will be used. When concrete pavement is slip formed, a metal recess strip is not required.
2. The term "In Place PCC Pavement" in the above drawing indicates that the in place PCC pavement was placed on the current project.
3. The epoxy coated deformed tie bars will be spaced in accordance with the following table:
   a. The tie bars will be placed a minimum of 15" from the transverse contraction joints.
   b. The required number of tie bars as shown in the tables will be uniformly spaced. Bar spacing for monolithically poured pavement shall be a maximum space of 48" center to center as shown in table above. Bar spacing adjacent to existing PCC pavement shall be a maximum space of 30" center to center as shown in table above. The maximum tie bar spacing will apply to tie bars within each panel.

PCC PAVEMENT LONGITUDINAL JOINTS WITH TIE BARS

DATE: 8-19-22
Sec. - Sht. 40-3b
LONGITUDINAL CONSTRUCTION JOINT WITH TIE BARS
(Individually Formed)

Concrete Gutter or
Concrete Curb
and Gutter

PCC Pavement

Sawed Joint Filled
With Hot Poured
Elastic Joint Sealer

Alternate Keyway

In Place Gutter or
Curb and Gutter

Notes:
1. No. 5 epoxy coated deformed tie bars will be spaced 48" center to center. The keyway may be formed in either the curb and
gutter (alternate keyway shown above) or the PCC pavement. No. 5 epoxy coated deformed tie bars will be placed 30" center to
center if a keyway is not installed.
2. The tie bars will be placed a minimum of 15" from existing transverse contraction joints.
3. The keyway is optional and is not required. When concrete pavement is formed and a keyway is provided, a metal recess strip
will be used. When concrete pavement is slip formed, a metal recess strip is not required.
4. The transverse contraction joints in the concrete gutter or concrete curb and gutter will match each mainline PCC pavement
transverse contraction joint.
5. The term "In Place Gutter or Curb and Gutter" in the above drawing indicates that the in place concrete gutter or concrete curb
and gutter was placed on the current project.

POURED MONOLITHICALLY

Concrete Gutter or
Concrete Curb
and Gutter

PCC Pavement

No. 5 Epoxy Coated Deformed Tie Bars

Line of Fracture

Notes:
1. No. 5 epoxy coated deformed tie bars will be spaced 48" center to center. The keyway may be formed in either the curb and
gutter (alternate keyway shown above) or the PCC pavement. No. 5 epoxy coated deformed tie bars will be placed 30" center to
center if a keyway is not installed.
2. The tie bars will be placed a minimum of 15" from existing transverse contraction joints.
3. The keyway is optional and is not required. When concrete pavement is formed and a keyway is provided, a metal recess strip
will be used. When concrete pavement is slip formed, a metal recess strip is not required.
4. The transverse contraction joints in the concrete gutter or concrete curb and gutter will match each mainline PCC pavement
transverse contraction joint.
5. The slope of the gutter will be the slope designated for the type of gutter or curb and gutter to be constructed. The bottom
slope of the gutter or curb and gutter will be constructed at the same slope as the mainline concrete pavement.

N.T.S.
Notes:

1. The term “In Place PCC Pavement” in the above drawing indicates that the pavement was placed on the current project or was placed on a previous project and is being tied to on the current project.
2. The first cut to control cracking for a sawed longitudinal joint shall be a minimum of 1/3 the thickness of the pavement. Additional sawing for widening the saw cut to provide for the installation of the hot poured elastic joint sealer is necessary.
3. The first cut to control cracking for a sawed transverse joint shall be a minimum of 1/4 the thickness of the pavement.
4. Transverse construction joints shall only be made at planned joint locations. Mid panel transverse construction joints shall not be constructed.
5. All hot pour elastic joint sealer material spilled on the surface of the concrete pavement shall be removed as soon as the material has cooled. The extent of the removal shall be to the satisfaction of the Engineer. All costs for removal of spilled joint sealer shall be borne by the Contractor.
Notes:
1. Longitudinal joint tie bars will be placed a minimum of 15" from the transverse contraction joints.
2. Centerline of individual dowel bars will be parallel to top of subgrade +/- 1/8" in 18" and to all other dowel bars in the assembly by +/- 1/16" in 18".
3. Centerline of individual dowel bars will be parallel to the centerline of the roadway to +/- 1/2" in 18".
4. The transverse contraction joints shall be sawed perpendicular to the centerline of the roadway and the dowel bars shall be centered on the sawed joint +/- 1".
5. Supporting devices as shown on this sheet, or equivalent as approved by the Engineer, will be used to maintain proper horizontal and vertical alignment of the dowel bars.

PCC PAVEMENT DOWEL BARS
SPALL REPAIR

SPALLS REQUIRING MULTIPLE MILLING PASSES SHALL EXTEND INTO SOUND CONCRETE ON ALL SIDES.

DISTANCE BETWEEN MULTIPLE SPALLS SHALL BE GREATER THAN 3'.

EXISTING JOINTS, TYP.

1 1/2" DEPTH INITIAL SAW CUT, TYP.

2 1/2" MINIMUM MILLED DEPTH.

12" MINIMUM MILLED WIDTH.

EXISTING JOINT.

JOINTS SHALL BE SAWED COMPLETELY THRU THE CONCRETE PLACED FOR THE SPALL TO MATCH EXISTING JOINT ALIGNMENTS AND SEALED WITH HOT TAR.

SPALL REMOval AREA.

3' MINIMUM REMOVAL LENGTH.

REMOVALS FOR SPALLS CLOSER THAN 4' SHALL BE COMBINED.

REMOVALS TO EXTEND A MINIMUM OF 6" BEYOND LIMITS OF SPALLS.

PLAN VIEW.

SECTION A-A.

DATE: 8-19-22.

N.T.S.

CITY OF RAPID CITY
PUBLIC WORKS DEPARTMENT
SPALL REPAIR

Sec. - Sht. 40-7a
Notes:
1. Spall quantities shown in the plans are approximate and are based on field measurements at the time of plans preparation. Spall repairs shall be marked in the field by the engineer and may vary from the plans based on field conditions.
2. Spalls will be marked out to the nearest whole foot. Removal is to extend 6 inches beyond the spall on transverse joints. Minimum length of removal shall be 3'. Joints containing spalls closer than 4' shall have the removal limits combined. Multiple milling passes may be required in areas where existing spalls are too wide to remove in one pass.
3. Spall repair areas shall be removed thru the use of a vertical edge milling machine. The milled width shall be a minimum of 12" and shall have a uniform depth of 2.5" over the area to be removed. An initial saw cut will be required around the perimeter of the removal area. The saw cut shall be a minimum of 1.5" depth to control edge chipping beyond the area to be repaired.
4. Prior to the placement of concrete the surface of the milled area shall be sand blasted to remove any additional unsound concrete and free latances. Compressed air shall then be used for the final cleaning of the surface. After final cleaning of the spall a bonding mortar shall be mixed and applied to all existing concrete surfaces (horizontal and vertical) to receive the spall fill material. The bonding mortar shall consist of the following proportions: 2 parts portland cement to 1 part sand. The portland cement and sand shall be mixed with enough water to form a thick creamy consistency. The Contractor may propose to utilize other commercially available bonding agents thru the submittal process.
5. The surface temperature shall be 40 degrees and rising prior to the placement of the bonding agent and concrete fill material. The concrete fill material shall be consolidated by the use of a small spud vibrator.
6. The final finishing procedure is to paint a sand-cement grout, the same grout used for the bonding mortar, at the edges of the repair to impede delamination of the patch. This ensures that a high percentage of cementitious material is available to glue the edges of the patch material to the existing concrete, helping to prevent the infiltration of moisture that can lead to delamination if water at the interface freezes in cold weather. The final surface shall be a broomed finish.
7. Joints shall be sawed to match existing joints and shall be sawed to the depth of the spall material plus 0.25". The sawed joint shall be sealed using hot tar.
8. Linseed oil cure shall be applied at a rate of 1 gallon per 75 SF. The repair areas shall be covered for 48 hours following the application of cure. Cold weather concreting procedures shall be followed during the 48 hour covering period, as needed.
9. Fill material for the spall areas shall be a commercially supplied redi-mix concrete conforming to the following proportions:
   - Cement: 750 lbs
   - Course agg: 1330 lbs
   - Fine agg: 1330 lbs
   - Air: 4.5% to 7.5%
   - Slump: 1" to 4"
   - Max w/c ratio: 0.42
   - Water reducer: As Needed
10. Course aggregate shall be 3/8 chip rock. Fly ash will not be allowed. A concrete mix design shall be submitted for acceptance prior to use on the project.
11. Payment for the spall repair will be by the square foot (SF) of repair. Payment shall include all work required to mill and remove existing, saw cutting to control edge chipping, final saw cutting, sealing, concrete placement and all associated items.
12. Processes and procedures for spall repair within this detail are from the National Concrete Pavement Technology Centers guide for partial depth repair of concrete pavements dated April 2012.

Spall Repair

Sec. - Sht.
40-7b
Concrete Paving Repair

Steel Bars for Transverse Joints
- Drilled epoxy coated plain round dowel bar 12" center to center. (See chart for size.)
- Drilled epoxy coated deformed tie bar 18" center to center. (See chart for size.)

DBA Dowel Basket Assembly (See chart for size.)

Steel Bars for Longitudinal Joints
- No. 5 x 30" epoxy coated deformed tie bars. Placed in monolithic pavement centered on joint - spaced 48" center to center.
- No. 5 x 24" epoxy coated deformed tie bars. Drilled and epoxied 9" minimum depth into existing concrete - spaced 30" center to center.

Steel Bars for Curb and Gutter and Concrete Fillets
- No. 5 x 24" epoxy coated deformed tie bars. Drilled and epoxied 9" minimum depth into existing curb and gutter.
- No. 5 x 24" epoxy coated smooth dowel bars. Drilled and epoxied 9" minimum depth into existing curb and gutter.
- No. 5 x 30" epoxy coated deformed tie bars. Placed in monolithic pavement centered on joint - spaced 48" center to center.
- No. 5 x 24" epoxy coated deformed tie bars. Drilled and epoxied 9" minimum depth into existing concrete - spaced 30" center to center.
- No. 4 x 24" epoxy rebar. Drilled and epoxy 9" minimum depth into existing concrete. See Section 60 details for spacing.

Notes:
1. Concrete shall be sawed full depth. Final removal limits are shown. A second saw cut is required for all concrete removals.
2. Joints, both transverse and longitudinal, shall be constructed to match existing joints unless directed by the Engineer.
3. Joints shall be sawed and sealed as per details.
